scale 0.873 Mean 20.285; Variance 23.245; Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

secretion
Claim 22; Page 16; 35pp; German.
This variant of the peptide described in P50491 has a mol.wt.
This variant of the peptide described in P50491 has a mol.wt.
of 13,000 and an isoelectric point of 6.6.5. This peptide
hormone, as well as its C-terminal fragments obtained by
partial bromcyan separation between the Met groups and
behind the latter, has strong relaxation activity on smooth
vasomuscles. It also affects sweat secretion and can be used for
the diagnosis and therapy of hypertension. It can also be used for
the treatment of post-operative cardiovascular disorders, skin
diseases, etc. The hormone may be prepared from a heart atrium
struct. See also P50491-2. Gaps WPI: 85-171361/28. The inventors claim a polypeptide comprising atrial natriuretic/vasodilator polypeptide (ANVP), pro-ANVP or pre-pro-ANVP, or their fragments. The encoding DNA sequence is also claimed. The claimed polypeptides are natriuretics, diuretics, vasodilators and modulators of the renin-angiotensin-aldosterone system. Dose is

Disclosure; Column 4: 19pp; English.

Confidence represents the human atrial natriuretic factor prohormone (proANF). Fragments of this sequence (see W34521-W34523) can be used in the method of the invention. The method is for treating hypertension, congestive heart failure, pulmonary oedema, toxeamia of pregnancy.

Consisting of amino acids 1-30, 31-67 or 79-98 of proANF. The peptides constitution of amino acids 1-30, 31-67 or 79-98 of proANF. The peptides by prekalaemia associated with acidosis, digitalis overdose, succinylcholine, insulin deficiency, acute or chronic renal failure, durents, natriuretic and/or kalluretic activity.

New DNA sequences from human atrium cordis - coding for new diuretic polypeptide or precursor cpds.

Claim 25; Fig 5; S19p; Bnglish.

The precursor of human gamma-ANP and its 26Asn-151Tyr fragmentare claimed (P50036, P50037), as are the DNA SQs encoding them (N50020,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Disclosure; Fig 1A; 45pp; English.

This sequence is encoded by the human pre-pro atrial natriuretic/vasodilator peptide (ANVP) DNA. Fragments of this protein and the corresponding sequence in rat (see also R36936), may be used for regulation of fluid volume and blood pressure in host organisms.

The ANVP fragments may be produced by solid-phase techniques. See
                                                                                                                                                                              Human, pre-pro; atrial natriuretic/vasodilator peptide; ANVP; rat; regulation; fluid volume; blood pressure.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptide cpd. - useful as natriuretic, dluretic and/or vasodilator in mammals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 03-SEP-1991 (first entry)
Sequence of the precursor of human gamma-atrium natriuretic polypeptide (ANP).
Natriuretic; diuretc; hypotensive; antihypertensive.
Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 279; DB 7; Length 151;

Physio-active peptide derived from birds - has cysteine bridge, specified As sequence and diuretic and antihypertensive properties. Disclosure; Fig 14; 16pp; Japanese.
This sequence has 99 amino acid residues homologous to the pre-chANP. See also 003466-003468, R03301 and R03402.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polypeptide cpd. - useful as natriuretic, diuretic and/or vasodilator in mammals
Disclosure; Fig 1B; 45pp; English.
This sequence is encoded by the human pre-pro atrial natriuretic/vasodilator peptide (ANVP) cDNA. Fragments of this protein and the corresponding sequence in rat (see also R3695), may be used for regulation of fluid volume and blood pressure in host organisms. The ANVP fragments may be produced by solid-phase techniques. See

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            corresp. DNA sequences, useful as antihypertensive agents.
Disclosure: Fig. 13; 45pp; English.
The DNA encoding the cardiodilatin is carried on plasmid pHANR48.
Cardiodilatin is a muscle relaxant, so is useful as an antihypertensive agent: The DNA is obtd. from RNA isolated from the human heart.

This sequence was isolated from a cDNA library prepared from poly(A) mRNA isolated from human heart. Sequences complementary to the DNA encoding MERIG of cardionatrin were isolated using maxture of oligonucleotide probes. Two plasmids, phAYD and phMANP, identified by this screening process, were then used to transform E.coli which were cultured to produce the peptide.

individuals at risk of hypertension and permits early therapeutic measures to prevent the fatal symptomology of the disease. The section of the genome which is fingerprinted or otherwise subject is study using the results is dependent on the nature of the probe. The probes useful in the present invention are selected from the renin, kallikrein, or ANF gene (see FT).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             03-AUG-1992 (first entry)

New atrial poly:peptide cpds. - useful as natriuretics, diuretics, vasodilators and modulators of the renin-angiotensin-aldosterone system

Example: Fig 1A: 144pp: English.

The inventors claim a polypeptide comprising atrial natriuretic/ vasodilator polypeptide (ANVP), pro-ANVP or pre-pro-ANVP, or their fragments. The encoding DNA sequence is also claimed. The claimed polypeptides are natriuretics, diuretics, vasodilators and modulators of the renin-anglotensin-aldosterone system. Dose is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

Patent No. 5767239

GENERAL INFORMATION:
APPLICANT: IMMER, Hansueli
APPLICANT: ADERMANN, Wolf-Georg
APPLICANT: ALESSEN, Christian
TITLE OF INVENTION: PROCESS AND INTERNEDIATE PRODUCTS FOR
TITLE OF INVENTION: PREPARING CARDIODILATIN FRAGMENTS, AND HIGHLY PURIF.
TITLE OF INVENTION: CARDIODILATIN FRAGMENTS, AND HIGHLY PURIF.
NUMBER OF SEQUENCES: 5
                      APPLICANT: Oare, pavid
APPLICANT: McDowell, Robert S.
APPLICANT: McDowell, Robert S.
APPLICANT: Burnier, John
TITLE OF INVENTION: PECEPTOR SPECIFIC ATRIAL NATRIURETIC
TITLE OF INVENTION: PEPTIDES
NUMBER OF SEQUENCES: 47
CORRESPONDENCE ADDRESS:

Title: >VANDER-027-213.PEP
Description: (1-37) from vander027777.pep
Perfect Score: 279
Sequence: 1 LRALLTAPRSLRRSSCFGGRMDRIGAQSGLGCNSFRY 37

Scoring table: PAM 150 Gap 11

Searched: 122810 seqs, 40068593 residues

Post-processing: Minimum Match 0% Listing first 45 summaries Database: pir60 1:pir1 2:pir2 3:pir3 4:pir4 Statistics: Mean 32.756; Variance 52.653; scale 0.622

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
